AMENDMENT UNDER 37 C.F.R. § 1.312   Page 2
Serial Number: 09/672,711   Dkt: 884.984US1 (INTEL)
Filing Date: September 29, 2000
Title: HOST-FABRIC ADAPTER HAVING HARDWARE ASSIST ARCHITECTURE AND METHOD OF CONNECTING A HOST SYSTEM TO
     A CHANNEL-BASED SWITCHED FABRIC IN A DATA NETWORK
Assignee: Intel Corporation

IN THE CLAIMS

Please amend claims 4, 5, 9, 12, 19, 25, 34, and 36 as follows, wherein no other claims are

amended by this 37 C.F.R. § 1.312 amendment:

1. (Previously Presented) A host-fabric adapter installed at a host system for connecting to a

switched fabric of a data network, comprising:

a Micro-Engine (ME) arranged to establish connections and support data transfers via

said switched fabric;

a serial interface arranged to receive and transmit data packets from said switched fabric

for data transfers; and

a host interface arranged to receive and transmit host data transfer requests, in the form of

descriptors, from said host system for data transfers, and incorporated therein a host interface

Hardware Assist (HWA) mechanism configured to pre-process host descriptors for descriptor

format errors in parallel with descriptor fetches so as to offload said Micro-Engine (ME) from

having to check for said descriptor format errors.

2. (Previously Presented) The host-fabric adapter as claimed in claim 1, wherein said host

interface Hardware Assist (HWA) mechanism comprises:

a Descriptor Format Checker arranged to check host descriptors from said host system for

said descriptor format errors using predetermined descriptor format rules and descriptor contents

in response to a ME instruction from said Micro-Engine (ME); and

a Descriptor Register Array arranged in parallel with said Descriptor Format Checker to

supply descriptor status information to said Micro-Engine (ME) when descriptor fetching

operations are completed.

3. (Previously Presented) The host-fabric adapter as claimed in claim 2, wherein said host

descriptors from said host system provide information needed to complete send/receive, remote

direct memory access (RDMA) write/read operations for data transfers, and include send/receive

descriptors utilized to control transmission/reception of a single data packet, and remote direct

memory access (RDMA) descriptors utilized to additionally indicate the address of remote

information.

4. (Currently Amended) The host-fabric adapter as claimed in claim 1, further comprising:

        a Receive first-in/first out (FIFO) [[FIFO]] interface arranged to receive data packets

from said switched fabric via said serial interface; and

        a Transmit first-in/first out (FIFO) [[FIFO]] interface arranged to transmit data packets to

said switched fabric via said serial interface.

5. (Currently Amended) The host-fabric adapter as claimed in claim 4, wherein said Receive

first-in/first out (FIFO) [[FIFO]] interface incorporates therein a Protection Index and Offset

Hardware Assist (HWA) mechanism configured to process the Virtual Address (VA) and

Memory Handle (MH) of an incoming data packet, via the serial interface, and generate

therefrom a Protection Index (PI) and Offset so as to offload said Micro-Engine (ME) from

processing data packets for RDMA read/write operations.

6. (Previously Presented) The host-fabric adapter as claimed in claim 5, wherein said

Protection Index and Offset Hardware Assist (HWA) mechanism comprises:

        a packet Buffer arranged to temporarily store an incoming data packet from the serial

interface;

        a packet Loading Logic arranged to start loading the data packet from said packet Buffer

in response to an ME instruction from said Micro-Engine (ME);

        a Protection Index and Offset Logic arranged to calculate the Protection Index (PI) and

Offset based on the Virtual Address (VA) and associated Memory Handle (MH) of the incoming

data packet from the packet Buffer in accordance with a load Virtual Address (VA) request from

said packet Loading Logic; and

        a Multiplexer arranged to select, as an output, the Protection Index (PI) and Offset needed

for each task of said Micro-Engine (ME) in response to said ME instruction from said Micro-Engine (ME).

7. (Previously Presented) The host-fabric adapter as claimed in claim 6, wherein said packet Buffer is a single packet first-in/first-out (FIFO) storage device.

8. (Previously Presented) The host-fabric adapter as claimed in claim 6, wherein said Protection Index (PI) and Offset are obtained by said Protection Index and Offset Logic using the following formula:

$$Offset = VA\ (11{:}0);\ and$$

$$Protection\ Index\ (PI) = VA\ (43{:}12) - MH\ (31{:}0),$$

where the Offset is the lower 12-bits of the Virtual Address (VA) of the incoming data packet to indicate which bytes within a single page are being addressed.

9. (Currently Amended) The host-fabric adapter as claimed in claim 6, wherein said Protection Index and Offset Logic comprises:

a plurality of task Virtual Address Registers arranged to receive the Virtual Address (VA) from the data packet and the load Virtual Address request in response to an ME instruction from said Micro-Engine (ME);

task Multiplexers arranged to obtain the Offset from the Virtual Address (VA) from the data packet previously registered in different Virtual Address Registers;

a Subtractor arranged to subtract the Memory Handle (MH) of the data packet input from the Virtual Address (VA) of the data packet previously;

a plurality of task Protection Index Registers arranged to load the result of the subtraction in accordance with the load Protection Index (PI) request and the ME instruction from said Micro-Engine (ME); and

an output Multiplexer arranged to select between outputs of different task Protection Index Registers as the Protection Index (PI) in response to the ME instruction from said Micro-

Engine (ME).

10. (Previously Presented) The host-fabric adapter as claimed in claim 6, wherein said
Protection Index and Offset Logic comprises:

a first Register arranged to receive the data packet and generate therefrom the Offset in
accordance with the load Virtual Address request;

a Subtractor arranged to subtract the Memory Handle (MH) from the Virtual Address
(VA) of the data packet; and

a second Register arranged to generate the Protection Index (PI) based on the result of the
subtraction in accordance with the load Protection Index (PI) request.

11. (Previously Presented) The host-fabric adapter as claimed in claim 4, further comprising:

an address translation interface which provides an interface for address translation, and
which is addressable by write data and system controls from said Micro-Engine (ME), via a
system data bus and a system control bus;

a context memory which provides an interface to a context manager, and which is
addressable by write data and system controls from said Micro-Engine (ME), via said system
data bus and said system control bus, for providing the necessary context for a work queue pair
used for sending and receiving data packets;

a local bus interface which provides an interface to a local bus, and which is addressable
by write data and system controls from said Micro-Engine (ME), via said system data bus and
said system control bus, for supporting system accessible context connections and data transfers;
and

a completion queue/doorbell manager interface which provides an interface to
completion queues, and doorbell and memory registration rules, and which is addressable by
write data and system controls from said Micro-Engine (ME), via said system data bus and said
system control bus.

Title: HOST-FABRIC ADAPTER HAVING HARDWARE ASSIST ARCHITECTURE AND METHOD OF CONNECTING A HOST SYSTEM TO
    A CHANNEL-BASED SWITCHED FABRIC IN A DATA NETWORK
Assignee: Intel Corporation

12. (Currently Amended) The host-fabric adapter as claimed in claim 4, wherein said Micro-Engine (ME) comprises:

one or more Data Multiplexers arranged to supply appropriate interface data based on an ME instruction;

an Instruction Memory arranged to provide said ME instruction based on downloadable microcode;

an Arithmetic Logic Unit (ALU) arranged to perform mathematical, logical and shifting operations, and supply write data to the host interface, the address translation interface, the context memory interface, the local bus interface, the completion queue/doorbell manager interface, the Receive first-in/first out (FIFO) [[FIFO]] interface and the Transmit first-in/first out (FIFO) [[FIFO]] interface, via said system write data bus; and

an Instruction Decoder arranged to supply system controls to the host interface, the address translation interface, the context memory interface, the local bus interface, the completion queue/doorbell manager interface, the Receive first-in/first out (FIFO) [[FIFO]] interface and the Transmit first-in/first out (FIFO) [[FIFO]] interface, via said system control bus, to execute said ME instruction from said Instruction Memory to control operations of said Data Multiplexers, and to determine functions of said Arithmetic Logic Unit (ALU).

13. (Previously Presented) The host-fabric adapter as claimed in claim 12, wherein said Instruction Memory corresponds to a static random-access-memory (SRAM) provided to store microcode that are downloadable for providing said ME instruction to said Instruction Decoder.

14. (Previously Presented) The host-fabric adapter as claimed in claim 1, wherein said host interface, said serial interface and said Micro-Engine (ME) are configured in accordance with the "*Virtual Interface (VI) Architecture Specification*", the "*Next Generation Input/Output (NGIO) Specification*" and the "*InfiniBand^{TM} Specification*".

Title: HOST-FABRIC ADAPTER HAVING HARDWARE ASSIST ARCHITECTURE AND METHOD OF CONNECTING A HOST SYSTEM TO
    A CHANNEL-BASED SWITCHED FABRIC IN A DATA NETWORK
Assignee: Intel Corporation

15. (Previously Presented) A host-fabric adapter installed at a host system for connecting to a switched fabric of a data network, comprising:

a Micro-Engine (ME) arranged to establish connections and support data transfers via said switched fabric;

a serial interface arranged to receive and transmit data packets from said switched fabric for data transfers;

a host interface arranged to receive and transmit host data transfer requests, in the form of descriptors, from said host system for data transfers; and

a first-in/first-out (FIFO) interface arranged to receive and transmit data packets to/from said switched fabric via said serial interface, and incorporated therein a Protection Index and Offset Hardware Assist (HWA) mechanism configured to process the Virtual Address (VA) and Memory Handle (MH) of data packets and generate therefrom a Protection Index (PI) and Offset so as to offload said Micro-Engine (ME) from having to process all data packets for data transfers.

16. (Previously Presented) The host-fabric adapter as claimed in claim 15, wherein said Protection Index and Offset Hardware Assist (HWA) mechanism comprises:

a packet Buffer arranged to temporarily store an incoming data packet from the serial interface;

a packet Loading Logic arranged to start loading the data packet from said packet Buffer in response to an ME instruction from said Micro-Engine (ME);

a Protection Index and Offset Logic arranged to calculate the Protection Index (PI) and Offset based on the Virtual Address (VA) and associated Memory Handle (MH) of the incoming data packet from the packet Buffer in accordance with a load Virtual Address (VA) request from said packet Loading Logic; and

a Multiplexer arranged to select, as an output, the Protection Index (PI) and Offset needed for each task of said Micro-Engine (ME) in response to said ME instruction from said Micro-Engine (ME).

a first-in/first-out (FIFO) interface arranged to receive and transmit data packets to/from

said switched fabric via said serial interface, and incorporated therein a Protection Index and

Offset Hardware Assist (HWA) mechanism configured to process the Virtual Address (VA) and

Memory Handle (MH) of data packets and generate therefrom a Protection Index (PI) and Offset

so as to offload said Micro-Engine (ME) from exclusively processing data packets for data

transfers.

29. (Previously Presented) The host-fabric adapter as claimed in claim 28, wherein said host

interface Hardware Assist (HWA) mechanism comprises:

a Descriptor Format Checker arranged to check host descriptors from said host system for

said descriptor format errors using predetermined descriptor format rules and descriptor contents

in response to a ME instruction from said Micro-Engine (ME); and

a Descriptor Register Array arranged in parallel with said Descriptor Format Checker to

supply descriptor status information to said Micro-Engine (ME) when descriptor fetching

operations are completed.

30. (Previously Presented) The host-fabric adapter as claimed in claim 29, wherein said host

descriptors from said host system provide information needed to complete send/receive, remote

direct memory access (RDMA) write/read operations for data transfers, and include send/receive

descriptors utilized to control transmission/reception of a single data packet, and remote direct

memory access (RDMA) descriptors utilized to additionally indicate the address of remote

information.

31. (Previously Presented) The host-fabric adapter as claimed in claim 28, wherein said

Protection Index and Offset Hardware Assist (HWA) mechanism comprises:

a packet Buffer arranged to temporarily store an incoming data packet from the serial

interface;

a packet Loading Logic arranged to start loading the data packet from said packet Buffer

in response to an ME instruction from said Micro-Engine (ME);

a Protection Index and Offset Logic arranged to calculate the Protection Index (PI) and

Offset based on the Virtual Address (VA) and associated Memory Handle (MH) of the incoming

data packet from the packet Buffer in accordance with a load Virtual Address (VA) request from

said packet Loading Logic; and

a Multiplexer arranged to select, as an output, the Protection Index (PI) and Offset

needed for each task of said Micro-Engine (ME) in response to said ME instruction from said

Micro-Engine (ME).

32. (Previously Presented) The host-fabric adapter as claimed in claim 31, wherein said packet

Buffer is a single packet first-in/first-out (FIFO) storage device.

33. (Previously Presented) The host-fabric adapter as claimed in claim 31, wherein said

Protection Index (PI) and Offset are obtained by said Protection Index and Offset Logic using the

following formula:

Offset = VA (11:0); and

Protection Index (PI) = VA (43:12) - MH (31:0),

where the Offset is the lower 12-bits of the Virtual Address (VA) of the incoming data

packet to indicate which bytes within a single page are being addressed.

34. (Currently Amended) The host-fabric adapter as claimed in claim 31, wherein said

Protection Index and Offset Logic comprises:

a plurality of task Virtual Address Registers arranged to receive the Virtual Address (VA)

from the data packet and the load Virtual Address request in response to an ME instruction from

said Micro-Engine (ME);

task Multiplexers arranged to obtain the Offset from the Virtual Address (VA) from the

data packet previously registered in different Virtual Address Registers;

a Subtractor arranged to subtract the Memory Handle (MH) of the data packet input from

the Virtual Address (VA) of the data packet previously;

a plurality of task Protection Index Registers arranged to load the result of the subtraction

in accordance with the load Protection Index (PI) request and the ME instruction from said

Micro-Engine (ME); and

an output Multiplexer arranged to select between outputs of different task Protection

Index Registers as the Protection Index (PI) in response to the ME instruction from said Micro-

Engine (ME).

35.   (Previously Presented) The host-fabric adapter as claimed in claim 31, wherein said

Protection Index and Offset Logic comprises:

a first Register arranged to receive the data packet and generate therefrom the Offset in

accordance with the load Virtual Address request;

a Subtractor arranged to subtract the Memory Handle (MH) from the Virtual Address

(VA) of the data packet; and

a second Register arranged to generate the Protection Index (PI) based on the result of the

subtraction in accordance with the load Protection Index (PI) request.

36.   (Currently Amended) The host-fabric adapter as claimed in claim [[1]] 31, wherein said

host interface, said serial interface, and said FIFO interface and said Micro-Engine (ME) are

configured in accordance with the "*Virtual Interface (VI) Architecture Specification*", the "*Next

Generation Input/Output (NGIO) Specification*" and the "*InfiniBand^{TM} Specification*".
